

PL-7008: Create agents in Microsoft Copilot Studio

Module 5: Enhance Microsoft Copilot Studio agents

Microsoft Learn module

Enhance Microsoft Copilot Studio agents

<https://learn.microsoft.com/training/modules/enhance-power-virtual-agents-bots/>

Learning Objectives

After completing this module, you will be able to:

- 1** Create agent flows
- 2** Use agent flows as tools
- 3** Use generative orchestration to improve your agent's responses

Create agent flows

Core tool types

1 Prebuilt connector action

2 Custom connector action

3 Agent flow

4 Prompt

5 ... and more

Use agent flows as tools in Copilot studio

Simplify automation for your agent

- Automate tasks with structure and consistency
- Utilize AI-driven intelligence to handle complex scenarios

Create an agent flow

- Tools tab
- Add a tool
- New agent flow

Agents and agent flows: better together

- Access information from other systems
- Handle complex scenarios
- Automate fixed components

Demo - Create an agent flow as a tool

Practice Labs

Lab 7: Create agent flows

Generative orchestration

Generative AI features

In Copilot Studio, you can use the following generative AI features:

Create an instantly useful agent: With no manual authoring of topics required, an "empty" agent can generate answers based on knowledge sources you specify such as websites and files.

Harness AI general knowledge: When this option is enabled, the agent can answer general questions unrelated to your specific knowledge sources or topics.

Author topics using natural language: Describe what you want your topic to do, and Copilot Studio creates it for you. Your agent includes conversational responses and multiple types of nodes.

Enable generative actions: Let the agent select the most appropriate topics and actions at runtime

Generative orchestration

How should your agent respond?

- Agent can automatically select the most appropriate action or topic, to respond to a user at runtime
- Specify content moderation level for agent

AI general knowledge

Enable AI to use its own general knowledge

- **Accessibility:** The agent can instantly access a vast repository of information and expertise across a wide range of subjects
- **Versatility:** It's capable of addressing diverse topics and tasks, making it a versatile resource for a variety of needs

The screenshot shows the Microsoft Copilot Studio interface. The top navigation bar includes 'Overview', 'Knowledge' (highlighted with a red box), 'Topics', 'Actions', 'Analytics', and 'Channels'. Below the navigation bar is a light blue banner with the text 'Your copilot is ready! Here's what's next:' and three steps: 'Add actions', 'Build topics', and 'Publish your copilot'. Below the banner is the 'Details' section, which includes a 'Name' field with the value 'Natural Language Copilot', a 'Description' field with the value 'Demonstrate the use of natural language understanding in copilots', and an 'Instructions' field with the value 'Create a copilot for topics relating to natural language understanding (NLU) for copilots creating with Microsoft Copilot Studio. The copilot answers in 20 words or less. Use bullets wherever possible.' Below the 'Details' section is the 'Knowledge' section, which includes a '+ Add knowledge' button and a red box around the toggle switch for 'Allow the AI to use its own general knowledge (preview)' which is currently 'Enabled'.

Knowledge sources for Generative answers

The supported knowledge sources are:

Public Website

Searches the query input on Bing, only returns results from provided websites

SharePoint

Connects to a SharePoint URL, uses GraphSearch to return results

Dataverse

Connects to the connected Dataverse environment and uses retrieval-augmented generative technique in Dataverse to return results

File Upload

Searches uploaded documents, returns results from the document contents

Content moderation

High (default): Agent generates fewer answers, but the responses will be more relevant.

Medium: Agent will generate more answers, but the responses might be less relevant.

Low: Agent will generate the most answers, but responses can have inaccuracies.

Practice Labs

Lab 8: Use Generative AI in Microsoft Copilot Studio

Lab 9: Deploy an agent to Microsoft Teams

agents*

Module 4

1. Use your PC or mobile device
2. Go to (*insert polling app link of your choice*)
3. Enter code: **123-45-678**
4. Please participate

Which one?

- A. None
- B. A little
- C. Lots

Knowledge Check

1 What is the primary difference between generative orchestration and classic orchestration?

A) Generative orchestration selects topics based on trigger phrases, while classic orchestration selects topics based on their descriptions.

✓ B) Generative orchestration selects topics based on their descriptions, while classic orchestration selects topics based on trigger phrases.

C) Generative orchestration can only use tools explicitly called from within a topic, while classic orchestration can choose tools based on their names and descriptions.

D) Generative orchestration does not support multilingual capabilities, while classic orchestration does.

Solution

Answer=B

Knowledge Check

2 How does generative orchestration enhance the agent's ability to respond to user queries?

- A) By using predefined responses for each query.
- B) By relying solely on the agent's primary language.
- C) By using only the most recent conversation history to generate responses.
- ✓ D) By selecting and combining multiple topics, tools, other agents, and knowledge sources based on their descriptions.

Solution

Answer=D

Knowledge Check

3 What is a trigger in the context of agent flows?

- A) A task that an agent flow performs.
- ✓ B) An event that starts a flow.
- C) A condition that stops a flow.
- D) A loop that repeats actions in a flow.

Solution

Answer=B

Summary

- Agent flows can be created to handle complex scenarios in Copilot Studio
- Generative orchestration feature can improve your agent's responses by using specific knowledge when generating answers

Module Recap

In this module, we:

Learned how to use agent flows

Learned how to add agent flows as tools

Learned how to use the generative orchestration feature to improve your agent's responses

Thank you.
